

Harness the power of modern Microsoft® database tools.
Translate VSAM data to Microsoft SQL Server with NeoData.

VSAM to SQL Server. NeoData translates VSAM indexed data into Microsoft SQL server. With NeoData, you're free to use your data how you like it. Get instant reports and view data whenever and however you want. Use VSAM data with web-based databases. Do it all without rewriting code.

Analyze Automatically. NeoData analyzes data record definitions and maps them to SQL data tables. It can also customize the mapping to fit your needs.

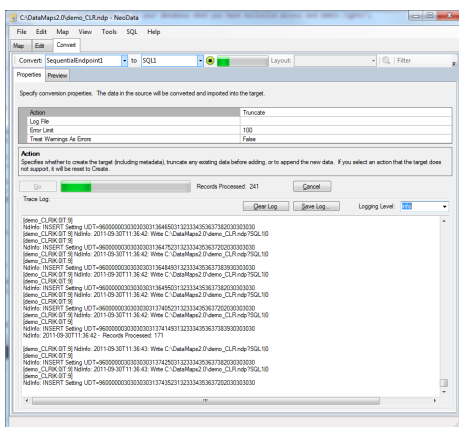

Retain Code. Use your existing COBOL apps. NeoData works with standard COBOL indexed file I/O statements, but can read and write SQL data. That means you'll be able to use your COBOL apps without rewriting them.

Standard Data Structures. Pick from several standard SQL data table structures and modify them to meet your needs. NeoData is fully customizable—you'll get the best database for your business.

Easy-to-use Interface. NeoData features an easy-to-use interface that makes mapping mainframe index files to SQL data tables simple. Define data types and sets using drop-down menus, check boxes and radio buttons. Test file translation scripts before translating all your data.

Features

- Analyzes record definitions and maps them to SQL tables
- Supports SQL-CLR User Defined Types
- Works with COBOL indexed file I/O—use existing COBOL mainframe applications
- Includes SQL data table types
- Migrates mainframe EBCDIC to Windows ASCII
- Ability to fully schematize data into relational databases
- Easy-to-use conversion, editing and mapping tools

NeoData Converter

The NeoData Converter automates the transition from VSAM indexed files to SQL Server data tables. Define how VSAM data files are fed into SQL tables, how those tables are organized and more. Do it all through one easy-to-use interface.
